# Kader Genç

**Software Engineer** · Backend

Software Engineer building payment systems and shared backend platforms, including a pipeline processing 200 million messages daily. Independently identified an unmet automation need and built a tool using TypeScript, Node.js, and PostgreSQL; it is now actively used by 20+ teams and has since gained contributions from other engineers.

Open to remote roles and international relocation with visa sponsorship

## TECHNICAL SKILLS

| | |
|---|---|
| **Languages:** | Go, Java, Kotlin, TypeScript/JavaScript, Python, SQL |
| **Backend:** | Spring, Node.js, NestJS · APIs, microservices, SDKs |
| **Data:** | PostgreSQL, Couchbase, Kafka, Kafka Streams |
| **Infrastructure:** | Docker, Kubernetes, GitLab CI/CD |
| **Testing:** | Unit tests for Node.js, JVM/Kotlin, and Go · Integration test automation with Testcontainers |

## EXPERIENCE

### Trendyol · E-commerce

**Jun 2022 — Present**

**Software Engineer · Remote**

> **Intern → Junior Software Engineer → Software Engineer**

- Replatformed a payment spending consumer using Go, Kafka, and PostgreSQL, owning delivery end to end. The pipeline processes **200 million messages daily**; diagnosed memory issues through heap analysis and resolved consumer lag with application-level throttling, addressing an earlier flow that required restarts to recover under high traffic.
- Contributed across analysis, design, development, and production rollout of a centralized Java configuration platform with Go, JVM, and Node.js SDKs. Replaced duplicated team-level eligibility logic with a shared service supporting seller, country, region, segment, and default priorities; SDKs resolve configuration once per request and propagate it through the request context.
- Identified an unmet need for automated engineering workflows and independently initiated and built a tool from scratch using TypeScript, Node.js, and PostgreSQL. Drove adoption across **20+ teams**, where it is now actively used, and subsequently attracted contributions from engineers within and beyond the team. Integrated GitLab, Jira, vulnerability, and test-quality data sources through scheduled jobs to automate manual tracking and surface overlooked issues.
- Recently added AI-agent workflows to the automation tool, with adoption still at an early stage. These workflows turn a single manual trigger into task creation and sprint assignment, automating previously five-to-six-step processes such as creating work items for failing tests and coverage gaps identified through Sonar and other quality platforms.
- Migrated tightly coupled credit card workflows into the new payment architecture, owning delivery end to end as part of the broader payment replatforming effort.
- Reduced failed pipelines by **68%** by correcting execution rules and removing duplicate jobs. Maintained team CI/CD pipelines, added caching, and reorganized job dependencies to shorten execution times.
- Previously developed advertising-domain features and services using Node.js, Go, Kotlin/Java, React, and Svelte, working with Kafka Streams, Couchbase, and PostgreSQL. Since March 2025, focused on payment and shared platform products used by other Ads teams.

## EARLIER EXPERIENCE

### Turkey National Observatories
**Sep 2021 — Jun 2022**

**Student Researcher (Part-time) · Erzurum, Turkey**

Developed OPC UA integration for DAG-MAM systems at the Eastern Anatolia Observatory as an undergraduate graduation project, using C++ and Python to automate telescope sub-devices.

### Atatürk University Big Data Management Office
**Sep 2021 — Jun 2022**

**Student Researcher (Part-time) · Erzurum, Turkey**

Collected and processed university data with Python for international ranking submissions; contributed to a WordPress platform for Sustainable Development Goals reporting.

### TÜBİTAK Marmara Research Center
**Jun 2021 — Aug 2021**

**Project Intern · İstanbul, Turkey**

Developed a C# automation tool for employees of the Polar Research Institute to support scientific expeditions.

### TÜBİTAK SAGE
**Jan 2021 — Feb 2021**

**Project Intern · Ankara, Turkey**

Implemented UDP socket communication between sender and receiver systems and developed TFTP file-transfer functionality.

## PROJECT

### Comrade
TypeScript/JavaScript · Synchronized movie and TV playback for small groups using the mpv player and Socket.io.
github.com/kadergenc/comrade

## EDUCATION

### Atatürk University
**2017 — 2022**

Bachelor's Degree in Computer Engineering

## LEADERSHIP & ACHIEVEMENTS

### AtaUni Rocket Team · Avionics & Team Leadership

Avionics · 2018–2020
Co-leader · 2020–2022
IREC team co-leader · 2021–2023

Contributed to team leadership and avionics, developing rocket control software, ground stations, and flight-card systems. The team achieved first place at TEKNOFEST and was a finalist at IREC in the United States.

## VOLUNTEERING

**Turkey Technology Team Foundation:** Taught artificial intelligence and mobile programming to middle and high school students over 10 months and mentored student projects.

**University technology communities:** Organized technology competitions, software training, and conferences through ATUGEM Technology Club and Atatürk University Computer and IT Club.
